

1. (~~previously amended~~ Previously presented) An airborne contaminant indicating device adapted for attachment to a person's nose for indicating the presence of a microbial contaminant entrained in an air stream passing through the nose, said airborne contaminant indicating device comprising a member dimensioned to fit snugly within a nose without substantially obstructing the flow of air through the nose, said member having a surface that is in contact with air passing through the nose, said surface being operable for immobilizing an airborne pathogenic organism.

2. (~~presently~~ Currently amended) An airborne contaminant indicating device adapted for attachment to a person's nose for indicating the presence of a microbial contaminant entrained in an air stream passing through the nasal passage of the nose, said airborne contaminant indicating device comprising:

- (a) a dilating portion comprising two substantially U-shaped strips of an elastically deformable biocompatible material, said substantially U-shaped strips lying substantially in a first plane and being mirror images of one another and having a substantially uniform width and a smooth outer, tissue-contacting surface and an inner air-contacting surface in opposition thereto; and
- (b) an extension portion integral with said dilating portion comprising two straight strips of said elastically deformable biocompatible material having a length and said substantially uniform width, each of said two straight strips having a proximal end integral with one of the two U-shaped strips, a distal end, and an outer septum-contacting surface which is coplanar with at least a portion of said tissue-contacting surface of said U-shaped strip integral therewith; and

- (c) a septum attachment portion comprising a substantially arcuate strip of said elastically deformable material having said substantially uniform width, said substantially arcuate strip having two parallel straight edges, each straight edge being integral with a distal end of one of said straight strips comprising the extension portion wherein said two straight strips and said arcuate strip lie in a second plane which is orthogonal to said first plane; and
- (d) a ~~contaminant interactive~~ coating on said outer surface of said dilating portion, ~~said outer surface~~ operable for immobilizing an airborne pathogenic organism.

3. (canceled) A kit for use with a airborne contaminant indicating device in accordance with claim 1 comprising visualization means operable for indicating exposure of said contaminant interactive coating to an airborne contaminant.

4. (canceled) A kit for use with a airborne contaminant indicating device in accordance with claim 2 comprising visualization means operable for indicating exposure of said contaminant interactive coating to an airborne contaminant.
